

PP3 - Decision Trees

Group 37
Rajas Bhate
Noah McIvor

To run the program, make sure the Group37.zip is located in your current directory within the student cluster and run:

unzip Group37.zip

Once unzipped, build the executable "pp3":

g++ -Wall -std=c++11 pp4.cpp -o pp4

Now, execute this executable file:

./pp4

When prompted to "Enter the filename: ", enter "**input.txt**", which is included in the zip folder. If using other types of text files for testing, don't forget to include the ".txt" at the end.

From here, select one of the four options. These will prompt you through what to input, depending on which option is selected.

After each of the four options, you'll be asked to continue or not.
